

## ABSTRACT

The study “How to improve the warehouse operations at Trischel Fabric (pvt) Ltd” is prepared for the purpose of identifying the key issues of warehouse operations, analyze them and ultimately brings up with appropriate solutions for the issues of efficiency identified in Trischel Fabric (pvt) Ltd. Upon the application of the solutions in to the issues, the implemented efficiency could be brought out. The descriptive model has been used for the analysis of data which consist with basically four equations implemented on simple logic of calculating efficiency.

The commencing of the research states the title which is developed based on a question type format including all the important wordings for the research such as efficiency, improvement. Convince the improvement of the warehouse operations efficiency in particular company is the overall aim. As the author observed a need of increasing the efficiency in the company warehouse operations, the study has been conducted. Since it needs to be perceived in a transparent manner, the study has been proceeded as a quantitative study with a small qualitative study for a single operation out of four operations. For the purpose of obtaining ideas regarding the past literatures, a literature review is being conducted capturing 5 literatures as main references. Collection of data and analyzing of them with interpretation gives the idea of existing efficiency and the efficiencies after the implementation of the suggestions. A bar code system is the used method of achieving the findings. Calculations for the demonstrations have been stated clearly in analysis of the study in terms of operation and interpretation as well. The ultimate expectation of study is to bring productivity to the company through improved warehouse operations.
